

The ORANKA beverage system with its closed stainless steel base and patented cooling transmission provides you with an even greater level of product quality and safety through the hermetically sealed Aroma-Safe-Lid.

The patented liquid seal shields the aroma of the beverage from disappearing, while additionally ensuring that no ambient air can access the tank. This seal is unique in relation to cleaning and hygiene: it consists only of water! Pressure equalization merely occurs in a fraction of seconds when beverage is extracted – the liquid seal ensures that only the extracted volume is being replaced by ambient air. This represents an almost complete hermetical seal, as shown by the following example:

- The ORANKA dispenser with 10 litres of content, thus 50 fruity portions at 0,2 litres, is being filled once daily.
- In conventional standard dispensers the beverage is in contact with the ambient air for a full 24 hours (or 86.400 seconds).
- The liquid air seal of the **ORANKA dispenser with Aroma-Safe** opens only for approximately half a second at a time upon every second product extraction – thus in total for about 12 seconds. **The achieved air seal amounts to 99.99%.**

The valuable ingredients stay fresh and the vitamin C content is being preserved to a maximum through the additionally employed Aroma-Cap. The ORANKA Aroma-Safe-System equates in principle to a cooled beverage bottle that is being air-tightly closed after every single portion.
